Introduction Parameterized generalized equations Problem statement Motivations from robust and vector optimization Solution stability issues

Parameterized generalized equations in their standard format

 $(PGE) 0 \in f(p,x) + G(p,x)$ 

where the problem data are:  $f: P \times \mathbb{X} \longrightarrow \mathbb{Y}$  single-valued mapping  $G: P \times \mathbb{X} \rightrightarrows \mathbb{Y}$  set-valued mapping (P, d) is a metric (parameter) space  $(\mathbb{X}, \|\cdot\|), (\mathbb{Y}, \|\cdot\|)$  are Banach spaces, **0** is the null vector in  $\mathbb{Y}$ .

Main historical motivations:

- equality/inequality constraint systems;
- cone constraint systems;
- optimality conditions;
- variational inequalities;
- fixed points;
- equilibria.

Parameterized generalized equations Problem statement Motivations from robust and vector optimization Solution stability issues

### Main problem

The main problem addressed in this talk is to conduct a solution stability analysis for parameterized set-valued inclusions, namely for the following problem:

$$(PSV) F(p,x) \subseteq C,$$

where the problem data are:  $F : P \times \mathbb{X} \rightrightarrows \mathbb{Y}$  a set-valued mapping  $C \subseteq \mathbb{Y}$  a closed, convex cone, with  $\{\mathbf{0}\} \neq C \neq \mathbb{Y}$ .  $(\mathbb{X}, \|\cdot\|)$  and  $(\mathbb{Y}, \|\cdot\|)$  are Banach spaces,  $\mathbf{0}$  is the null vector in  $\mathbb{Y}$ . The solution mapping  $S : P \rightrightarrows \mathbb{X}$  associated with (PSV) is defined as

 $\mathcal{S}(p) = \{x \in X : F(p, x) \subseteq C\}.$ 

Key feature: (PGE) and (PSV) seem to be problems with a different nature. (PSV) can not be easily cast in the traditional generalized equation format.

Parameterized generalized equations Problem statement Motivations from robust and vector optimization Solution stability issues

### A robust approach to uncertain optimization

Consider a cone constrained optimization problem with uncertainty

 $\min \varphi(x,\omega)$  subject to  $f(x,\omega) \in C$ ,

where  $x \in X$  is the decision vector,  $\omega \in \Omega$  is a data element  $\varphi : \mathbb{X} \times \Omega \longrightarrow \mathbb{R}$  is the objective function (affected by uncertainty)  $f : \mathbb{X} \times \Omega \longrightarrow \mathbb{Y}$  and  $C \subset \mathbb{Y}$  define the cone (uncertain) constraint. If the decision environment is characterized by:

- a crude knowledge of the data: all is known about  $\omega$  is that  $\omega \in \Omega$ ;
- the constraint must be satisfied, whatever the actual realization of  $\omega \in \Omega$  is;

then, after [BenNem98], a robust approach to uncertain optimization leads to consider  $F : \mathbb{X} \Longrightarrow \mathbb{Y}$  given by

$$F(x) = f(x, \Omega) = \{y \in \mathbb{Y} : f(x, \omega), \omega \in \Omega\},\$$

and hence to face the set-valued inclusion  $F(x) \subseteq C$ .

-

Parameterized generalized equations Problem statement Motivations from robust and vector optimization Solution stability issues

### Ideal efficient solutions in vector optimization

Let  $f : \mathbb{X} \longrightarrow \mathbb{Y}$  be a mapping taking values in a space  $(\mathbb{Y}, \leq_C)$  partially ordered by a cone C and let  $R \subset \mathbb{X}$ .  $\bar{x} \in R$  is said to be an ideal *C*-efficient solution to the problem

C-min f(x) subject to  $x \in R$ 

#### if

$$f(\bar{x}) \leq_C f(x), \ \forall x \in R,$$

or equivalently, if

 $f(R) \subseteq f(\bar{x}) + C.$ 

By setting  $F_{f,R}(x) = f(R) - f(x)$ , one readily sees that  $\bar{x}$  is ideal *C*-efficient iff it solves the set-valued inclusion

$$F_{f,R}(x) \subseteq C.$$

### Solution stability issues

Issues to be considered for a solution stability analysis: let  $S : P \rightrightarrows X$  be the solution mapping associated with a (*PSV*).

- **(Solution existence:** Fix  $\bar{p} \in P$ . Upon which conditions  $S(\bar{p}) \neq \emptyset$ ?)
- 2 Local solvability: If  $S(\bar{p}) \neq \emptyset$ , upon which conditions  $S(p) \neq \emptyset$  for p near  $\bar{p}$ ?
- **③** Local stability: If  $\bar{p}$  ∈ int dom S (i.e.  $S(p) \neq \emptyset$ ,  $\forall p \in B(\bar{p}, \delta)$ ), when are the values S(p) 'near'  $S(\bar{p})$ ? In which sense 'near'? Can we measure such a nearness phenomenon?
- Sensitivity: Whenever it is possible to quantify the changes of S, under which conditions they are proportional to the changes of p. Can we measure the 'rate of change'? Can we provide first-order approximations of S?

イロト イボト イヨト イヨト

To embed the solution stability analysis of (PSV) in the framework of variational analysis one needs the above properties: let  $\Phi : X \Rightarrow Y$  be a mapping between metric spaces and  $(\bar{x}, \bar{y}) \in \text{gph } \Phi$ .  $\Phi$  is said:

• to be Lipschitz lower semicontinuous at  $(\bar{x}, \bar{y})$  if  $\exists \delta, \ell > 0$ :

$$(*) \qquad \Phi(x) \cap B(\bar{y}, \ell d(x, \bar{x})) \neq \varnothing, \ \forall x \in B(\bar{x}, \delta);$$

the modulus of Lipschitz lower semicontinuity of  $\boldsymbol{\Phi}$  is defined as

$$\operatorname{Liplsc} \Phi(\bar{x},\bar{y}) = \inf\{\ell > 0: \ \exists \delta > 0 \text{ for which } (*) \text{ holds} \}.$$

• to be calm at 
$$(\bar{x}, \bar{y})$$
 if  $\exists \delta, \zeta, \ell > 0$ :

$$(**) \quad \Phi(x) \cap B(\bar{y},\zeta) \subseteq B(\Phi(\bar{x}),\ell d(x,\bar{x})), \ \forall x \in B(\bar{x},\delta);$$

the modulus of calmness of  $\Phi$  at  $(\bar{x}, \bar{y})$  is defined as

$$\operatorname{clm} \Phi(\bar{x}, \bar{y}) = \inf\{\ell > 0: \exists \delta, \zeta > 0 \text{ for which } (**) \text{ holds}\}.$$

• to be Lipschitz upper semicontinuous at  $\bar{x} \in X$  if  $\exists \delta, \ell > 0$ :

$$(***)$$
  $\Phi(x) \subseteq B(\Phi(\bar{x}), \ell d(x, \bar{x})), \ \forall x \in B(\bar{x}, \delta);$ 

the modulus of Lipschitz upper semicontinuity at  $\bar{x}$  is defined as

 $\operatorname{Lipusc} \Phi(\bar{x}) = \inf\{\ell > 0: \ \exists \delta > 0 \text{ for which } (***) \text{ holds} \}.$ 

• to have the Aubin property at  $(\bar{x}, \bar{y})$  if  $\exists \delta, \zeta, \ell > 0$ :

 $(+) \quad \Phi(x_1) \cap B(\bar{y},\zeta) \subseteq B(\Phi(x_2), \ell d(x_1,x_2)), \ \forall x_1, x_2 \in B(\bar{x},\delta);$ 

the modulus of Aubin continuity of  $\Phi$  at  $(\bar{x}, \bar{y})$  is defined as

 $\operatorname{Lip} \Phi(\bar{x}, \bar{y}) = \inf\{\ell > 0 : \exists \delta, \zeta > 0 \text{ for which } (+) \text{ holds} \}.$ 

• to be Lipschitz continuous around  $\bar{x}$  if  $\exists \delta, \ell > 0$ :

(++) haus $(\Phi(x_1), \Phi(x_2)) \leq \ell d(x_1, x_2), \quad \forall x_1, x_2 \in B(\bar{x}, \delta).$

3

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

#### Remark (Connections between Lipschitzian properties)

- Lipschitz lower semicontinuity and calmness are independent of each other.
- ② Lipschitz upper semicontinuity ⇒ Calmness ⇐ Aubin property ⇐ Lipschitz continuity
- Whenever Φ : X → Y is single-valued near x̄, Lipschitz lower semicontinuity = Lipschitz upper semicontinuity = 'calmness' in the sense of Rockafellar, i.e. ∃δ, ℓ > 0:

 $d(\Phi(x), \Phi(\bar{x})) \leq \ell d(x, \bar{x}), \ \forall x \in B(\bar{x}, \delta),$ 

which implies the classic continuity of  $\Phi$  at  $\bar{x}$ .

 Φ has the Aubin property at (x̄, ȳ) iff Φ<sup>-1</sup> is metrically regular (equivalently, open at a linear rate) at (ȳ, x̄).

(日)

In order to conduct a study of the solution stability of (PSV), observe that

$$\mathcal{S}(p) = F^{+1}(p, \cdot)(C).$$

Standing assumptions:

- $\mathbf{0} \quad \mathrm{dom} \, F = P \times X; \qquad F \text{ takes closed values;}$
- (X, d) metrically complete.

Technique of analysis via merit function: define  $\nu_{F,C}: P \times X \longrightarrow [0, +\infty]$  (it measures the inclusion violation)

$$\nu_{F,C}(p,x) = \exp(F(p,x), C) = \sup_{y \in F(p,x)} \operatorname{dist}(y, C),$$

where dist  $(y, C) = \inf_{c \in C} d(y, c)$ .

Remark (Functional characterization of S)

Under the above assumptions

$$S(p) = F^{+1}(p, \cdot)(C) = [\nu_{F,C}(p, \cdot) = 0] = \nu_{F,C}(p, \cdot)^{-1}(0).$$

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### Basic tool for the analysis in metric spaces: slopes

Given  $\varphi: X \longrightarrow \mathbb{R} \cup \{\pm \infty\}$  and  $x_0 \in \varphi^{-1}(\mathbb{R})$  the extended-real value

$$|
abla arphi|(x_0) = \left\{egin{array}{ccc} 0 & ext{if } x_0 ext{if }$$

if  $x_0$  is a local minimizer for  $\varphi$ , otherwise,

is called (strong) slope of  $\varphi$  at  $x_0$ . The extended-real value

$$\overline{|\nabla \varphi|}^{>}(x_0) = \liminf_{x \to x_0 \atop \varphi(x) \downarrow \varphi(x_0)} |\nabla \varphi|(x).$$

is called strict outer slope of  $\varphi$  at  $x_0$ . If  $\nu : P \times X \longrightarrow \mathbb{R} \cup \{\pm \infty\}$  and  $(\bar{p}, \bar{x}) \in P \times X$ , the extended-real value  $|\nabla_x \nu|(\bar{p}, \bar{x}) = \begin{cases} 0 & \text{if } (\bar{p}, \bar{x}) \in P \times X \\ 0 & \text{if } (\bar{p}, \bar{x}) \text{ is a local minimizer} \\ for \nu, \\ 0 & \text{lim sup} \frac{\nu(\bar{p}, \bar{x}) - \nu(\bar{p}, x)}{d(x, \bar{x})} & \text{otherwise} \end{cases}$ 

is called partial slope of u, with respect to x, at  $(ar{p}_{\omega}ar{x})$ .

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

A sufficient condition for Lipschitz lower semicontinuity of  ${\cal S}$ 

Define the following ad hoc variant of partial strict outer slope

 $\overline{|\nabla_x \nu_{F,C}|}^{>}(\bar{p},\bar{x}) = \liminf_{\substack{(p,x) \to (\bar{p},\bar{x}) \\ \nu_{F,C}(p,x) \downarrow \nu_{F,C}(\bar{p},\bar{x})}} |\nabla \nu_{F,C}(p,\cdot)|(x).$ 

#### Theorem (Lipschitz l.s.c. of $\mathcal{S}$ )

With reference to a (PSV), let  $\bar{p} \in P$  and  $\bar{x} \in S(\bar{p})$ . Suppose: (i)  $\exists \delta > 0$ :  $F(p, \cdot) : X \rightrightarrows Y$  l.s.c. on  $X, \forall p \in B(\bar{p}, \delta)$ ; (ii)  $F(\cdot, \bar{x}) : P \rightrightarrows Y$  Lipschitz u.s.c. at  $\bar{p}$ ; (iii)  $|\nabla_x \nu_{F,C}|^> (\bar{p}, \bar{x}) > 0$ . Then,  $S : P \rightrightarrows X$  is Lipschitz l.s.c. at  $(\bar{p}, \bar{x})$  and

$$\operatorname{Liplsc} \mathcal{S}(\bar{\boldsymbol{p}}, \bar{x}) \leq \frac{\operatorname{Lipusc} F(\cdot, \bar{x})(\bar{\boldsymbol{p}})}{|\nabla_{x} \nu_{F,C}|^{>}(\bar{\boldsymbol{p}}, \bar{x})}.$$

- 4 同 6 4 日 6 4 日 6

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### A sufficient condition for the calmness of ${\mathcal S}$

By using the following different variant of partial strict outer slope

$$\overline{|\nabla \nu_{F,C}(\bar{p},\cdot)|}^{>}(\bar{x}) = \liminf_{\substack{x \to \bar{x} \\ \nu_{F,C}(\bar{p},x) \downarrow \nu_{F,C}(\bar{p},\bar{x})}} |\nabla \nu_{F,C}(\bar{p},\cdot)|(x), \quad \text{one obtains}$$

#### Theorem (Calmness of $\mathcal{S}$ )

With reference to a (PSV), let  $\bar{p} \in P$  and  $\bar{x} \in S(\bar{p})$ . Suppose: (i)  $F(\bar{p}, \cdot) : X \rightrightarrows Y$  l.s.c. on X; (ii) F locally Lipschitz near  $(\bar{p}, \bar{x})$ ; (iii)  $|\nabla \nu_{F,C}(\bar{p}, \cdot)|^{>}(\bar{x}) > 0$ . Then,  $S : P \rightrightarrows X$  is calm at  $(\bar{p}, \bar{x})$  and

$$\operatorname{clm} \mathcal{S}(\bar{p}, \bar{x}) \leq rac{\operatorname{Lip} F(\bar{p}, \bar{x})}{|\nabla 
u_{F,C}(\bar{p}, \cdot)|^{>}(\bar{x})}.$$

く 目 トーイ ヨ トーイ ヨ ト

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### A sufficient condition for Lipschitz upper semicontinuity of ${\mathcal S}$

Define modulus of Lipschitz continuity with respect to p, uniformly in x

 $\operatorname{Lip}_{p} F(\bar{p}, X) = \inf\{\ell > 0 : \exists \delta > 0 : \sup_{x \in X} \operatorname{haus}(F(p_{1}, x), F(p_{2}, x)) \leq \ell d(p_{1}, p_{2})$ 

and a nonlocal regularization of the slope

$$\forall p_1, p_2 \in \mathrm{B}(ar{p}, \delta) \}$$

$$\tau_{\bar{p}} = \inf\{|\nabla \nu_{F,C}(\bar{p},\cdot)|(x): x \in X \setminus \mathcal{S}(\bar{p})\}$$

#### Theorem (Lipschitz upper semicontinuity of $\mathcal{S})$

With reference to (PSV), let  $\bar{p} \in P$ , with  $S(\bar{p}) \neq \emptyset$ . Suppose: (i)  $F(\bar{p}, \cdot) : X \rightrightarrows Y$  l.s.c. on X; (ii) F is locally Lipschitz near  $\bar{p}$  with respect to p, uniformly in  $x \in X$ ; (iii) it is  $\tau_{\bar{p}} > 0$ . Then, the solution mapping  $S : P \rightrightarrows X$  is Lipschitz u.s.c. at  $\bar{p}$  and

$$\operatorname{Lipusc} \mathcal{S}(\bar{p}) \leq \frac{\operatorname{Lip}_{p} \mathcal{F}(\bar{p}, X)}{\tau_{\bar{p}}}$$

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### A sufficient condition for Aubin property of ${\mathcal S}$

Given  $\delta > 0$ , define  $\sigma_{\nabla}(\delta) = \inf\{|\nabla_x \nu_{F,C}|(p,x): (p,x) \in [B(\bar{p},\delta) \times B(\bar{x},\delta)] \setminus \operatorname{gph} S\}.$ 

#### Theorem (Local solvability and Aubin property of $\mathcal{S})$

With reference to (PSV), let  $\bar{p} \in P$ , with  $S(\bar{p}) \neq \emptyset$ . Suppose: (i)  $\exists \delta_1 > 0$ :  $F(p, \cdot)$  l.s.c. on X,  $\forall p \in B(\bar{p}, \delta_1)$ ; (ii)  $F(\cdot, \bar{x})$  Hausdorff C-u.s.c. at  $\bar{p}$ ; (iii)  $\exists \delta_2 > 0$ :  $\sigma_{\nabla}(\delta_2) > 0$ . Then,  $\exists \eta, \zeta > 0$  such that (t)  $S(p) \cap B(\bar{x}, \eta) \neq \emptyset$ ,  $\forall p \in B(\bar{p}, \zeta)$ ; (tt) it holds dist  $(x, S(p)) \leq \frac{\nu_{F,c}(p,x)}{\sigma_{\nabla}(\delta_2)}$ ,  $\forall (p, x) \in B(\bar{p}, \zeta) \times B(\bar{x}, \eta)$ . Moreover, if (v)  $\exists \tau, s > 0$ :  $\forall x \in B(\bar{x}, s) F(\cdot, x)$  Lipschitz with rank  $\ell$  in  $B(\bar{p}, \tau)$ , then (ttt) S has the Aubin property at  $(\bar{p}, \bar{x})$  and  $\operatorname{Lip} S(\bar{p}, \bar{x}) \leq \ell/\sigma_{\nabla}(\delta_2)$ .

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### Analysis in Banach spaces

In the more structured setting of Banach spaces, one can:

- provide verifiable estimates of the partial strict outer slope of  $\nu_{F,C}$  in terms of problem data (F and C);
- study the first order behaviour of S by means of its generalized derivatives (in the spirit of implicit function theorems).

Standing assumption:

• C is a closed, convex nontrivial  $({\mathbf{0}} \neq C \neq \mathbb{Y})$  cone.

(4月) (3日) (3日)

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### Analysis tools in Banach spaces

#### Definition (metric *C*-increase)

A set-valued mapping  $\Phi : \mathbb{X} \rightrightarrows \mathbb{Y}$  is said to be (i) metrically *C*-increasing on  $\mathbb{X}$  if  $\exists \alpha > 1$  such that

$$(*) \quad \forall x \in \mathbb{X}, \ \forall r > 0 \ \exists u \in B(x, r) : B(\Phi(u), \alpha r) \subseteq B(\Phi(x) + C, r);$$

inc  $\Phi = \sup\{\alpha > 1 : \text{ inclusion (*) holds}\}$ 

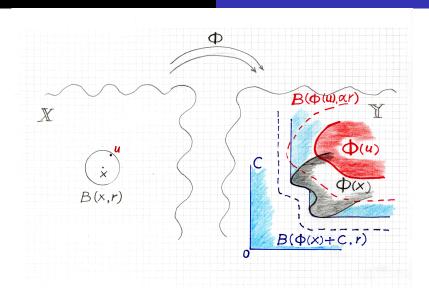

is the exact bound of metric *C*-increase of  $\Phi$ . (ii) metrically *C*-increasing around  $\bar{x} \in \operatorname{dom} \Phi$  if  $\exists \delta > 0, \exists \alpha > 1$ :

$$\begin{aligned} \forall x \in B(\bar{x}, \delta), \ \forall r \in (0, \delta) \ \exists u \in B(x, r) : \\ B(\Phi(u), \alpha r) \subseteq B(\Phi(x) + C, r); \end{aligned}$$

 $\operatorname{inc} \Phi(\bar{x}) = \sup\{\alpha > 1 : \operatorname{inclusion} (**) \operatorname{holds}\}$ 

is the exact bound of metric C-increase of  $\Phi$  around  $\bar{x}$ .

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

<ロト < 団ト < 団ト < 国ト

э

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

Remark (Scalar and single-valued case)

If  $C = (-\infty, 0]$  and  $\varphi : \mathbb{X} \longrightarrow \mathbb{R}$ ,  $\Phi = \varphi$  is metrically *C*-increasing around  $\bar{x}$  iff  $\exists \text{inc } \Phi(\bar{x}) > 1$  and  $\delta > 0$  such that for any  $\alpha \in (1, \text{inc } \Phi(\bar{x}))$ and  $r \in (0, \delta)$  $\inf_{x \in B(\bar{x}, r)} \varphi(x) \le \varphi(\bar{x}) - (\alpha - 1)r.$ 

Recall that, according to the decrease principle (in the sense of Clarke-Ledyaev),

$$\exists r, c > 0: \inf_{x \in B(\bar{x}, r)} |\nabla \varphi|(x) \ge c \quad \Rightarrow \quad \inf_{x \in B(\bar{x}, r)} \varphi(x) \le \varphi(\bar{x}) - cr.$$

So, the metric *C*-increase property can be regarded as a set-valued counterpart of a decrease principle (nonstationariety condition).

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### Some example and connections with the regularity behaviour

Let  $\Lambda : \mathbb{X} \to \mathbb{R}^m$  be a linear bounded operator,  $C = \mathbb{R}^m_+$ , with  $m \ge 2$ . Recall that  $\Lambda$  is onto iff  $\exists \alpha > 0$ :  $\Lambda \mathbb{B} \supseteq \alpha \mathbb{B}$  (Banach open mapping principle). Define

 $\operatorname{sur} \Lambda = \sup\{\alpha > 0 : \Lambda \mathbb{B} \supseteq \alpha \mathbb{B}\},$  (Banach constant of  $\Lambda$ )

then,  $\Lambda$  is onto iff  $\, {\rm sur}\,\Lambda > 0$  and the following characterization holds

$$\operatorname{sur} \Lambda = \inf_{\|u^*\|=1} \|\Lambda^\top u^*\| = \operatorname{dist} \left(\mathbf{0}^*, \Lambda^\top \mathbb{S}^*\right),$$

where  $\Lambda^{\top}$  denotes the adjoint operator to  $\Lambda$  and  $\mathbb{S}^*$  the dual unit sphere.

Example (Linear epimorphism as a metrically *C*-increasing mapping) Let  $\Lambda : \mathbb{X} \to \mathbb{R}^m$  be such that sur  $\Lambda > m \ge 2$ . Then,  $\Lambda$  is metrically  $\mathbb{R}^m_+$ -increasing on  $\mathbb{X}$  and inc  $\Lambda \ge \sqrt{m}$ .

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### Some example and connections with the regularity behaviour

Let  $f : \mathbb{X} \to \mathbb{R}^m$  be a smooth mapping,  $C = \mathbb{R}^m_+$ , with  $m \ge 2$ . Recall that f covers at a linear rate around  $\bar{x} \in \mathbb{X}$  if  $\exists \alpha, \delta > 0$ :

$$(*) \qquad f(B(x,r)) \supseteq B(f(x),\alpha r), \ \forall r \in (0,\delta), \quad \forall x \in B(\bar{x}\,\delta).$$

Define

$$\operatorname{sur}(f;\bar{x}) = \sup\{\alpha > 0: \exists \delta > 0: (*) \text{ holds}\}.$$

Letting  $\widehat{D}f(\overline{x})$  be the strict (Fréchet) derivative of f at  $\overline{x}$ , f covers at a linear rate around  $\overline{x}$  iff (by the Lyusternik-Graves theorem)

$$0 < \operatorname{sur}(f; \bar{x}) = \inf_{\|u^*\|=1} \|\widehat{\mathrm{D}}f(\bar{x})^\top u^*\| = \operatorname{dist}\left(\mathbf{0}^*, \widehat{\mathrm{D}}f(\bar{x})^\top \mathbb{S}^*\right).$$

#### Example (Locally surjective/metrically regular mappings)

Let  $f : \mathbb{X} \to \mathbb{R}^m$  be strictly differentiable at  $\bar{x}$  and such that  $\sup(f; \bar{x}) > m \ge 2$ . Then, f is metrically  $\mathbb{R}^m_+$ -increasing around  $\bar{x}$  and  $\inf(\bar{x}) \ge \sqrt{m}$ .

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### Other tools in Banach spaces

Definition (*C*-concavity for set-valued mappings)

A set-valued mapping  $\Phi : \mathbb{X} \rightrightarrows \mathbb{Y}$  is said to be *C*-concave on  $\mathbb{X}$  if

 $\Phi(tx_1 + (1-t)x_2) \subseteq t\Phi(x_1) + (1-t)\Phi(x_2) + C, \ \forall x_1, x_2 \in \mathbb{X}, \ \forall t \in [0,1].$ 

#### Example (loffe's fans)

A set-valued mapping  $H : \mathbb{X} \Longrightarrow \mathbb{Y}$  is called fan if it fulfils the properties: (i)  $\mathbf{0} \in H(\mathbf{0})$ ; (ii) H takes convex values; (iii)  $H(tx) = tH(x), \ \forall t > 0, \ \forall x \in \mathbb{X}$ ; (iv)  $H(x_1 + x_2) \subseteq H(x_1) + H(x_2), \ \forall x_1, \ x_2 \in \mathbb{X}$ . For instance, if  $\mathcal{G}$  is a convex and weakly closed subset of linear bounded operators between  $\mathbb{X}$  and  $\mathbb{Y}$ , then

$$\Phi_{\mathcal{G}}(x) = \{y \in \mathbb{Y}: \ y = \Lambda x, \Lambda \in \mathcal{G}\}$$
 is a fan.

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

Estimating slopes by means of (convex) subdifferentials

#### Remark

If  $F : P \times \mathbb{X} \rightrightarrows \mathbb{Y}$  is *C*-concave with respect to *x*, for each  $p \in P$ , then  $\nu_{F,C} : \mathbb{X} \longrightarrow [0, +\infty]$  is convex.

As a consequence  $|\nabla_x \nu_{F,C}|$  can be estimated by dist  $(\mathbf{0}^*, \partial \nu_{F,C}(p, \cdot)(x))$ . In turn dist  $(\mathbf{0}^*, \partial \nu_{F,C}(p, \cdot)(x))$  can be estimated from below by employing the *C*-increase property: under *C*-concavity and *C*-increase assumptions on  $\Phi$ , one has  $\exists \eta > 0$  such that

$$\inf_{u\in\mathbb{B}}\nu_{\Phi}'(x;u)\leq 1-\operatorname{inc}\Phi(\bar{x}),\quad\forall x\in\ B(\bar{x},\eta)\cap[\nu_{\Phi}>0]$$

and

$$\operatorname{dist} \left( \mathbf{0}^*, \partial \nu_{\Phi}(\boldsymbol{p}, \cdot)(\boldsymbol{x}) \right) \geq \operatorname{inc} \Phi(\bar{\boldsymbol{x}}) - 1, \quad \forall \boldsymbol{x} \in \ B(\bar{\boldsymbol{x}}, \eta) \cap [\nu_{\Phi} > 0].$$

- 母 ト - ヨ ト - ヨ ト

As a consequence, one obtains the following estimates

Theorem (Slope estimates in the *C*-concave case)

With reference to (PSV), let  $\bar{p} \in P$  and  $\bar{x} \in S(\bar{p})$ . Suppose  $F(p, \cdot)$  l.s.c., C-concave and bounded-valued away from C, for every  $p \in B(\bar{p}, \delta)$ . If

(i) F is metrically C-increasing w.r.t. x, uniformly in p, around  $(\bar{p}, \bar{x})$ , then

$$\overline{|
abla_x 
u_{F,C}|}^{>}(ar{p},ar{x}) \geq \operatorname{inc} F_x(ar{p},ar{x}) - 1 > 0;$$

(ii)  $F(\bar{p}, \cdot)$  is metrically *C*-increasing around  $\bar{x}$ , then

$$\overline{|\nabla \nu_{F,C}(\bar{p},\cdot)|}^{>}(\bar{x}) \geq \operatorname{inc} F(\bar{p},\cdot)(\bar{x}) - 1 > 0;$$

(iii)  $F(\bar{p}, \cdot)$  is metrically C-increasing on X, then

$$au_{ar{p}} \geq \operatorname{inc} F(ar{p}, \cdot) - 1 > 0.$$

### Differentiation notions for set-valued mappings

Let  $\Phi : \mathbb{X} \Longrightarrow \mathbb{Y}$  and  $x_0 \in \operatorname{dom} \Phi$ . A positively homogeneous set-valued mapping  $H_{\Phi}(x_0; \cdot) : \mathbb{X} \Longrightarrow \mathbb{Y}$  is said to be

• an outer prederivative of  $\Phi$  at  $x_0$  if  $\forall \epsilon > 0 \ \exists \delta > 0$ :

$$\Phi(x) \subseteq \Phi(x_0) + H_{\Phi}(x_0; x - x_0) + \epsilon ||x - x_0|| \mathbb{B}, \ \forall x \in B(x_0, \delta);$$

• an inner prederivative of  $\Phi$  at  $x_0$  if  $\forall \epsilon > 0 \ \exists \delta > 0$ :

$$\Phi(x_0) + H_{\Phi}(x_0; x - x_0) \subseteq \Phi(x) + \epsilon \|x - x_0\|\mathbb{B}, \ \forall x \in B(x_0, \delta).$$

#### Remark (Connection with the Bouligand derivative)

Whenever  $\Phi$  and  $H_{\Phi}(x_0; \cdot)$  are single-valued around  $x_0$ ,  $H_{\Phi}(x_0; \cdot)$  turns out to be a Bouligand derivative of  $\Phi$  at  $x_0$  in the sense of Robinson.

イロト イポト イラト イラト

The contingent derivative of  $\Phi$  at  $(x_0, y_0) \in \operatorname{gph} \Phi$  is the set-valued mapping  $D\Phi(x_0, y_0) : \mathbb{X} \rightrightarrows \mathbb{Y}$  defined via its graph by the equality

$$\mathrm{gph}\,\mathrm{D}\Phi(x_0,y_0)=\mathrm{T}(\mathrm{gph}\,\Phi;(x_0,y_0)),$$

where  $T(gph \Phi; (x_0, y_0))$  denotes the contingent (Bouligand tangent) cone to  $gph \Phi$  at  $(x_0, y_0)$ .

The Fréchet coderivative of  $\Phi$  at  $(x_0, y_0) \in \operatorname{gph} \Phi$  is the set-valued mapping  $\widehat{D}^* \Phi(x_0, y_0) : \mathbb{Y}^* \rightrightarrows \mathbb{X}^*$  defined by

$$\widehat{\mathrm{D}}^* \Phi(x_0,y_0)(y^*) = \{x^* \in \mathbb{X}^*: \ (x^*,-y^*) \in \widehat{\mathrm{N}}(\mathrm{gph}\,\Phi;(x_0,y_0))\}, \ \text{ where }$$

$$\widehat{\mathrm{N}}(\mathrm{gph}\,\Phi;(x_0,y_0)) = \left\{ w^* \in \mathbb{X}^* \times \mathbb{Y}^*_{\mathrm{gph}\,\Phi\ni(x,y)\to(x_0,y_0)} \frac{\langle w^*,(x,y)-(x_0,y_0)\rangle}{\|(x,y)-(x_0,y_0)\|} \leq 0 \right\}$$

denotes the Fréchet normal cone to  $gph \Phi$  at  $(x_0, y_0)$ .

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### A sufficient condition for the Aubin property of ${\mathcal S}$

Let  $(\bar{p}, \bar{x}) \in P imes \mathbb{X}, \ \delta > 0$  and

 $\sigma_{H}(\bar{p},\bar{x};\delta) = \inf\{\sigma_{H_{F(p,\cdot)}}(x): (p,x) \in [B(\bar{p},\delta) \times B(\bar{x},\delta] \setminus \operatorname{gph} \mathcal{S}\}.$ 

#### Theorem (Local solvability, error bound and Aubin property of $\mathcal{S})$

With reference to (PSV), let  $\bar{p} \in P$  and  $\bar{x} \in S(\bar{p})$ . Suppose: (i)  $\exists \delta_1 > 0: \forall p \in B(\bar{p}, \delta_1), F(p, \cdot)$  l.s.c. on  $\mathbb{X}$ ; (ii)  $F(\cdot, \bar{x})$  Hausdorff C-u.s.c. at  $\bar{p}$ ; (iii)  $\exists \delta_2 > 0: \forall p \in B(\bar{p}, \delta_2) F(p, \cdot)$  admits an outer prederivative  $H_{F(p, \cdot)}(x; \cdot)$  at each  $x \in B(\bar{x}, \delta_2)$  and  $\sigma_H(\bar{p}, \bar{x}; \delta_2) > 0$ . Then,  $\exists \eta, \zeta > 0: S(p) \cap B(\bar{x}, \eta) \neq \emptyset, \forall p \in B(\bar{p}, \zeta)$  and dist  $(x, S(p)) \leq \nu_{F,C}(p, x)/\sigma_H(\bar{p}, \bar{x}; \delta), \forall (p, x) \in B(\bar{p}, \zeta) \times B(\bar{x}, \eta)$ . ( $\nu$ ) If, in addition,  $\exists \tau, s > 0: \forall x \in B(\bar{x}, s) F(\cdot, x)$  is Lipschitz with constant  $\ell$  in  $B(\bar{p}, \tau)$ , then S has the Aubin property at  $(\bar{p}, \bar{x})$  and Lip  $S(\bar{p}, \bar{x}) \leq \frac{\ell}{\sigma_H(\bar{p}, \bar{x}; \delta_2)}$ .

イロト イポト イラト イラト

Henceforth, suppose also  $(\mathbb{P}, \|\cdot\|)$  to be a normed linear space. In such a setting, it is possible to investigate geometric properties of S.

A remarkable consequence on the first order (graphical) approximation of  ${\cal S}_{\cdot}$ 

#### Corollary (Graphical derivative of S)

Under hypotheses (i)-(v) of the previous theorem, dom  $DS(\bar{p}, \bar{x}) = \mathbb{P}$  and  $DS(\bar{p}, \bar{x}) : \mathbb{P} \Rightarrow \mathbb{X}$  is Lipschitz continuous on  $\mathbb{P}$ , with constant

$$\operatorname{LipDS}(\bar{p}, \bar{x}) \leq \frac{\ell}{\sigma_{H}(\bar{p}, \bar{x}; \delta_{2})}$$

- 4 同 ト - 4 目 ト

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### Geometric properties of $\mathcal{S}$ under C-concavity of F

#### Proposition (Convexity of S)

With reference to (PSV), suppose that  $F : \mathbb{P} \times \mathbb{X} \rightrightarrows \mathbb{Y}$  is *C*-concave on  $\mathbb{P} \times \mathbb{X}$ . Then,  $S : \mathbb{P} \rightrightarrows \mathbb{X}$  is a convex set-valued mapping. If  $(\bar{p}, \bar{x}) \in \operatorname{gph} S$ , then  $\mathrm{D}S(\bar{p}, \bar{x}) : \mathbb{P} \rightrightarrows \mathbb{X}$  is a closed convex process.

By combining the Aubin property and the convexity of  $\mathcal{S}$ , one obtains

#### Corollary (Lipschitz continuity of S under truncation)

With reference to (PSV), let  $(\bar{p}, \bar{x}) \in \operatorname{gph} S$ . Suppose that all hypotheses (i)-(v) are satisfied and F is C-concave on  $\mathbb{P} \times \mathbb{X}$ . Then S has a Lipschitz continuous (not necessarily, single-valued) graphical localization around  $(\bar{p}, \bar{x})$ , i.e.  $\exists V$  neighbourhood of  $\bar{p}$  and  $\exists U$  of  $\bar{x}$  such that the set-valued mapping  $p \rightsquigarrow S(p) \cap U$  is Lipschitz continuous on V.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

# Approximations of $\mathrm{D}\mathcal{S}(\bar{p},\bar{x})$

In the absence of convexity of S, there are formulae which provide inner/outer approximations of  $DS(\bar{p}, \bar{x})$  in terms of prederivatives of F.

#### Theorem (Inner approximation of $D\mathcal{S}(\bar{p},\bar{x})$ )

With reference of (PSV), let  $(\bar{p}, \bar{x}) \in \operatorname{gph} S$ . Suppose that: (i)  $F(\cdot, \bar{x})$  Hausdorff C-u.s.c. at  $\bar{p}$ ; (ii)  $\exists \delta_1 > 0$ :  $\forall p \in B(\bar{p}, \delta_1)$ ,  $F(p, \cdot)$  l.s.c. on  $\mathbb{X}$ ; (iii)  $\exists \delta_2 > 0$ :  $\forall p \in B(\bar{p}, \delta_2)$ ,  $F(p, \cdot)$  has  $H_{F(p, \cdot)}(x; \cdot)$  as an outer prederivative at each  $x \in B(\bar{x}, \delta_2)$  and  $\sigma_H(\bar{p}, \bar{x}; \delta_2) > 0$ ; (iv) F has  $H_F((\bar{p}, \bar{x}); \cdot)$  as an outer (joint) prederivative at  $(\bar{p}, \bar{x})$ . Then, it holds

 $\mathrm{D}\mathcal{S}(\bar{p},\bar{x})(p)\supseteq H_F^{+1}((\bar{p},\bar{x});(p,\cdot))(C),\quad \forall p\in\mathbb{P}.$ 

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

#### Theorem (Outer approximation of $\mathrm{D}\mathcal{S}(ar{p},ar{x}))$

With reference of (PSV), let  $(\bar{p}, \bar{x}) \in \operatorname{gph} S$ . Suppose that: (i) F has  $H_F((\bar{p}, \bar{x}); \cdot)$  as an inner (joint) prederivative at  $(\bar{p}, \bar{x});$ (ii)  $H_F((\bar{p}, \bar{x}); \cdot) : \mathbb{P} \times \mathbb{X} \rightrightarrows \mathbb{Y}$  is l.s.c. on  $\mathbb{P} \times \mathbb{X}$ . Then, it holds

 $(\diamond) \qquad \mathrm{D}\mathcal{S}(\bar{p},\bar{x})(p) \subseteq \bigcap_{y \in F(\bar{p},\bar{x})} H_F^{+1}((\bar{p},\bar{x});(p,\cdot))(\mathrm{T}(C;y)), \quad \forall p \in \mathbb{P}.$ 

#### Remark (Case $F(\bar{p}, \bar{x}) \subseteq \text{int } C$ )

In the case  $F(\bar{p}, \bar{x}) \subseteq \text{int } C$ , formula ( $\diamond$ ) gives no information. On the other hand, if F is u.s.c. at  $(\bar{p}, \bar{x})$ , in the present circumstance one has

 $\mathrm{D}\mathcal{S}(ar{p},ar{x})(p)=\mathbb{X},\quad \forall p\in\mathbb{P}.$ 

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

### A dual first-order approximation of ${\mathcal S}$

It is possible to provide further information about  ${\cal S}$  near (ar p,ar x) via its Fréchet coderivative.

#### Theorem (Coderivative of $\mathcal{S}$ )

With reference of (PSV), let  $(\bar{p}, \bar{x}) \in \operatorname{gph} S$ . Suppose that: (i)  $F(\cdot, \bar{x})$  Hausdorff C-u.s.c. at  $\bar{p}$ ; (ii)  $\exists \delta_1 > 0: \forall p \in B(\bar{p}, \delta_1), F(p, \cdot)$  l.s.c. on  $\mathbb{X}$ ; (iii)  $\exists \delta_2 > 0: \forall p \in B(\bar{p}, \delta_2), F(p, \cdot)$  has  $H_{F(p, \cdot)}(x; \cdot)$  as an outer prederivative at each  $x \in B(\bar{x}, \delta_2)$  and  $\sigma_H(\bar{p}, \bar{x}; \delta_2) > 0$ . Then  $\exists \zeta, \eta > 0: \forall (p, x) \in [\operatorname{int} B(\bar{p}, \zeta) \times \operatorname{int} B(\bar{x}, \eta)] \cap \operatorname{gph} S$  it holds

 $\widehat{\mathrm{D}}^*\mathcal{S}(p,x)(x^*) = \{p^* \in \mathbb{P}^* : \ (p^*, -x^*) \in \operatorname{cone} \widehat{\partial} \nu_{F,C}(p,x)\},\$ 

where  $\partial \nu_{F,C}(p,x)$  denotes the Fréchet subdifferential of  $\nu_{F,C}$  at (p,x) and cone the conic hull of a set.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

### Some open questions (representations of $\partial \nu_{F,C}$ )

Let  $\nu_{F,C} : \mathbb{X} \longrightarrow [0, +\infty]$  be defined by  $\nu_{F,C}(x) = \sup_{y \in F(x)} \operatorname{dist}(y, C)$ and let  $\overline{F} : \mathbb{X} \rightrightarrows \mathbb{Y}$  be defined by

 $\overline{F}(x) = \{y \in F(x) : \text{ dist } (y, C) = \nu_{F,C}(x)\}$  (farthest point mapping).

Under mild assumptions, it should be

$$\overline{\operatorname{co}}^* \bigcup_{y \in \overline{F}(\bar{x})} \widehat{D}F^*(\bar{x}, y) \left( \partial \operatorname{dist} \left( \cdot, C \right)(y) \right) \subseteq \partial \nu_{F, C}(\bar{x}).$$

**Problem 1**: If F is C-concave, under proper assumptions on the stability of  $\overline{F}$  near  $\overline{x}$ , is it true that

$$\overline{\operatorname{co}}^* \bigcup_{y \in \overline{F}(\overline{x})} \widehat{\mathrm{D}} F^*(\overline{x}, y) \left( \partial \operatorname{dist} \left( \cdot, C \right)(y) \right) = \partial \nu_{F,C}(\overline{x}) ?$$

**Problem 2**: Extend such a characterization to the non convex/concave case by using the Fréchet subdifferential (or other subdifferentials).

Lipschitzian properties Stability analysis in metric spaces Stability analysis in Banach spaces

## Conclusions

- Set-valued inclusions are problems which emerge in the robust approach to uncertain optimization and in vector optimization.
- Some perspectives on their solution stability can be drawn by tools and techniques of variational analysis.
- The resulting theoretical picture seems to be different from that for generalized equations (e.g. metric increase replaces metric regularity, concavity replaces convexity).
- Many aspects of the topic still remain to be investigated and clarified.
